Weekly Market Brief

AIB Treasury Economic Research Unit

August 30th – 3rd September 2021

Looking for Direction

- The action in some of the main currency pairs for much of the summer has generally being confined to fairly tight ranges. Indeed, the EUR/USD rate has, for the most part, traded in a compact \$1.17-1.19 corridor since mid-year. Meanwhile, EUR/GBP has spent most of this timeframe in a narrow 85-87p band, with a brief period below the 85p level, to a low of 84.5p earlier this month. The confined trading ranges are against a backdrop of all the main economies experiencing a rebound in growth amid an easing of restrictions, while their respective central banks have been maintaining expansionary monetary policy settings. However, at some point, we should start to see more noteworthy action amongst the majors. A key point of focus in this regard will be monetary policy, as interest rates are a crucial factor behind forex market dynamics. As mentioned above, their stability has been an important influence to the narrow trading ranges over the past year.
- From the perspective of the dollar, rate hikes are quite possible in the US next year. In contrast from a euro viewpoint, Eurozone rates look set to stay on hold for a long time, and thus remain deeply negative. A widening of interest rate differentials, if it were to materialise next year, should be supportive of the dollar. In the shorter term, the dollar may be supported by the tapering of asset purchases, which is expected by the Fed later this year, given that the ECB is expected to continue with the large scale buying of bonds for the next couple of years. One potential downside for the dollar though, could be a sustained rise in US inflation relative to elsewhere. Though US rates would have to rise, high inflation is usually a forerunner for currency weakness. Another possible headwind for the dollar may be if vaccine hesitancy results in continuing high Covid-19 infection numbers and hospitalisations in the US, restraining the pace of recovery and delaying hikes in interest rates,
- At the same time though, it is difficult to pinpoint any significant upside potential for the euro, given the outlook for Eurozone interest rates. On top of this, there is some looming political uncertainty from elections in Germany and France, this year and next, which may weigh on the currency. Thus, the balance of risk points to some upside potential for the dollar against the euro. Elsewhere, it is not easy to foretell the next major move in sterling. Market positioning is relatively neutral. The UK economy is performing quite well suggesting the currency should remain well underpinned after its very solid performance in recent months. Further out, if rate hikes materialise in the UK next year as markets expect, it could provide a fillip for sterling, especially against currencies with zero or negative interest rates like the euro.
- Turning to the week ahead, the main highlight will be the August US labour market report. This will garner close attention, as some key Fed officials have highlighted that they would need to see another month of strong jobs growth before backing a decision to announce a plan to start tapering asset purchases before the end of the year. Payrolls expanded by over 1.8 million in the June-July period as hiring in the US accelerated following the re-opening of the economy and a withdrawal of the enhanced jobless supports in some states. Nonetheless, payrolls remain close to 5.7m below their pre-pandemic level. The consensus is for payrolls to rise by a further 665,000 in August. Meantime, the unemployment rate is projected to fall to 5.2% from 5.4%.

- Elsewhere in the US, both the manufacturing and non-manufacturing ISMs are due. In July, the non-manufacturing ISM rose to 64.1, the highest level on record since the series began in 1997. In contrast the manufacturing ISM declined for the second month running, albeit to a still elevated level of 59.5, as supply chain pressures showed no sign of abating. The forecast is for both indices to remain firmly in expansion mode but to edge lower in August. Indeed, the Conference Board measure of Consumer Confidence is set to decline for the first time since December as concerns mount regarding the strength of the economic recovery, partly due to the Delta variant.
- There is a busy data schedule ahead in the Eurozone also. Both the EC services and industrial sentiment indices are projected to decline in August in a sign that growth may have peaked in the region. The consensus is for retail sales to have edged 0.2% higher in July. Elsewhere, the unemployment rate is expected to have continued to inch lower in July, falling to 7.6% from 7.7%. Meanwhile, headline HICP inflation is forecast to jump to 2.8% from 2.2% due to base effects. In the UK this week, house price data for August are the only release of note.
